Report

Things need to revise or update:

1. The visualization of the map looks good but it lacks description of each attribute. We can't assume users understand each attribute from the map and how the filter would affect the result, so I need to add a description table on the App to make it more user-friendly.

2. The color gradation of the map seems to have a vague meaning. Adding some descriptions to the App would make it clear.

3. The code part is straightforward, but some enums or big trunks of code still look confusing. Adding additional comments on the big trunks of code would make it easier for following programmers if they want to reuse my code.
